Cervellero Shows Missouri Steel Foundry How to Quickly Replace a Melting System

Stewart Pinsof, chairman of Monett Metals, was faced with a serious problem. The foundry’s primary induction melt power supply was found to have reliability and safety issues at a time when high levels of production were needed. His immediate response was to replace the equipment.

Pinsof noted that the urgent time constraints precluded a normal investigation of replacement options. He explained in a letter, “We opted to expedite the process by bringing in a consultant experienced in the induction melting industry. We interviewed three consultants and selected Paul Cervellero as being the most qualified for our project. The decision proved to be pivotal. Without the formality of proposals, time lines, charts and programs, Paul immediately understood our needs and provided invaluable guidance in the technology, sources, economics and timing aspects of our project. While a past president of Inductotherm, we found Paul’s input to be very even handed among all potential suppliers.” The letter concluded, “With Paul’s assistance, the project grew from a simple replacement into two larger and more efficient units. Availability, technical competence, economic pragmatism and the rare talent to confine contribution to essentials proved to be Paul’s formula for excellence.”
